

POKÉMON PORTFOLIO VALUATION

Scenario Lab

Compare grading assumptions, see the full range of outcomes, and learn which cards create the upside.

Collection loaded

5,631 cards from pricecharting.csv

[Choose CSV](#)[Scenario Lab](#)[Portfolio Tracker](#)[Grading Optimizer](#)[Sale Planner](#)[PSA 7 Price Audit](#)[Dataset Editor](#)[See D](#)

PROFIT VERSUS WORKLOAD

Find the smallest worthwhile grading batch

Compare several PSA scenarios across many ranked batch sizes. It answers: "How much median profit do I gain by grading the next group of cards—and where does that gain flatten out?"

Expected-value ranking

Starts with every eligible card, estimates each card's added value under the chosen PSA weights, then adds cards best-to-worst. This is the cleaner way to find diminishing returns.

Scenario comparison

Every selected PSA scenario gets its own color, risk band, and sweet spot on the same chart so you can see whether the efficient grading batch changes with grade assumptions.

OPTIMIZER SETTINGS

Choose PSA scenarios to compare

Collection costs, PSA fees, selling fees, volatility, and first-edition settings come from Scenario Lab.

Median \$126,936 · P5 \$85,950 · P95 \$247,228

RECOMMENDED METHOD

Cards ranked by expected added value

Each colored line is one PSA scenario. Cards are added from most valuable to least valuable under that scenario. Large dots mark each scenario's smallest batch that captures 95% of its maximum median-profit improvement.

7-heavy 8-heavy 9-heavy even even-conservative even-optimistic
even-with-outliers

No honest global sweet range exists for these scenarios. Every scenario reaches its 95% efficiency threshold only by 1,000 cards, but at least one scenario begins adding negative expected value after 0 cards. If avoiding negative-EV submissions under every assumption matters most, use the conservative

CARDS TO GRADE

650 of 4,981 cards

Use global recommendation

Use sweet spot

Use maximum median

650

-\$40,060 combined expected added value versus selling these cards raw. This is the calculated sweet spot.

This is 650 cards beyond the universally positive ceiling. The last included card contributes -\$67 in expected added value. 650 selected cards have negative individual expected added value.
